

Function with argument with return value in js

JS allows us to define such functions that take arguments and also return the value. It means while calling the function we can send the values on which the function operates and after doing all the operations in the function definition we can send back the result where the function is called.

The function with argument with return value has the following syntax of function definition/declaration:

1. Declaration:

```
function functionName(arguments)
{
    statement(s)
    return value
}
```

Example:

```
function getSum(a,b) {
    // code for the function goes here
    var c=a+b
    return c
}
```

2. Calling the Function: We use the following syntax to call a function with argument with return value:

```
variablename=functionName(arguments)
var x=getSum(100,200); // The getSum(100,200) will return the value that is stored into the x
```

Assignment:

Q1: Create a JS function that takes three numbers as arguments and returns the multiply of three numbers.

Q2: Create a JS function that takes two numbers as argument and returns the maximum.
