Passing a 2D array as a function argument in C

In C, we can pass a 2d array as an argument also. We use the following syntax while defining a function that takes a 2d array as the argument.

```
Return-type functionname(datatype matrixname[][cols])  
{  
    //the code goes here.  
}
```

To call this type of function we use the following syntax:

```
functionname(matrix name);
```
